At virtion we offer hosting and managed services to our customers and providing stable services to our customers is one of the most important things for us. We started using MooseFS in 2014 because we were looking for a reliable and easy to manage storage system for certain use cases – e.g. backup, archiving, file storage and much more.

After we evaluated a few Software Defined Storage / Distributed File Systems, we found MooseFS Pro. Our intensive testing showed that it was the most reliable one, and it still is – it requires very low maintenance efforts while delivering a very good performance and – much more important to us – stability.

The ease to manage a cluster in our hyper converged infrastructure – adding or replacing machines and disks over time, on the fly – led us to use MooseFS Pro for more and more use cases and customers supporting the ever-growing storage demand.

We have upgraded to MooseFS Pro 4.x recently, therefore we can start using a new feature of Erasure Coding available now which will allow us to save space on the cluster.
